1. What JX0 is

JX0 is a small humanoid robot designed to be built by one student at home, from a 3D printer and parts that can be ordered online in India. Its look and its joints follow a friend's working robot: a faceted green body, every joint a 12 V STS3215. It is the working prototype of the JX1 project: it uses the same design pipeline (gait planner, servo sizing, physics simulation) at a price a student can afford.

Specification

Height / mass	53.7 cm / 2.43 kg (CAD, all parts)
Joints	17, every one a Feetech STS3215 12 V serial bus servo (30 kg·cm stall, position feedback), like the reference robot
Legs	6 joints each: hip yaw, roll, pitch, knee, ankle pitch, roll
Arms and head	shoulder pitch and elbow per arm (a shoulder cradle and a flat blade), neck yaw under a soft rounded head
Brain	Raspberry Pi 4: 50 Hz gait playback with arm swing, IMU balance, offline speech recognition and voice
Talking	Claude over Wi-Fi writes the replies and calls the robot's actions (walk, turn, wave, nod, look)
Power	3S 2200 mAh LiPo (about 1 h of walking, ESTIMATED) or a 12.6 V bench supply
Structure	pastel green matte PLA (or PETG) on a home 3D printer: 20 parts, 415 g

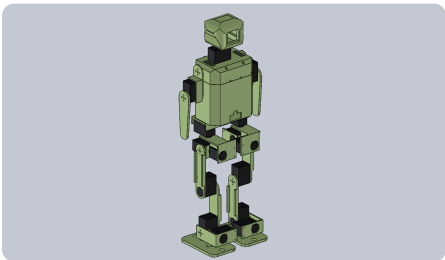

Done (on the computer)

- ✓ SolidWorks CAD: 20 printable parts and the full assembly with all 17 servos, built by script
 - ✓ Servo sizing for every leg joint: all pass (tightest margin 1.70×)
 - ✓ Walking in a physics simulation of the CAD robot: 14 of 14 gaits pass, arms swinging
 - ✓ Robot program (voice, Claude, walking, gestures) runs on the simulated robot; it rides out a side push
- Next: buy the parts → print → assemble → first steps

How this estimate was made

- Every line is a real product page at an Indian store (Robu, Evelta, Robocraze, ThinkRobotics, Quartz Components and others), price checked 24 Sep – 4 Oct 2026.
- GST is included where the store states it; shipping is not included.
- Two small lines (button, jumper wires) are ESTIMATED.
- Over the original ₹50,000 target because all 17 joints are STS3215, as on the reference robot.

From CAD to a working robot

SolidWorks assembly, back view

waving (simulation, the robot's own program)

kicks over a bottle, like the reference video

Five biggest lines

ITEM	MODEL	QTY	₹
Joint servo (all 17 joints: 12 legs, 4 arms, neck)	Feetech STS3215 12 V 30 kg·cm serial bus servo (sold as ST3...	17	₹41,123
Brain	Raspberry Pi 4 Model B 2 GB (with case)	1	₹7,000
Filament (the reference robot's pastel green)	eSun PLA-Matte 1.75 mm 1 kg, Mint Green	2	₹2,598
Battery	Bonka 3S 11.1 V 2200 mAh 35C LiPo	1	₹2,039
microSD card	SanDisk Ultra 32 GB A1	1	₹1,499

Why the STS3215 everywhere: the walking needs up to 1.73 N·m at the hip roll (with a 1.5× safety margin), more than MG996R-class hobby servos give; the serial bus servos also report their position, which the calibration and the balance loop use; and one servo type on one bus is how the reference robot is built.
